

Risk Register

Operational environment

The bank is located in a coastal area with low crime rates. Many people and systems handle the bank's data: 100 on-premise employees and 20 remote employees. The customer base of the bank includes 2,000 individual accounts and 200 commercial accounts. The bank's services are marketed by a professional sports team and ten local businesses in the community. There are strict financial regulations that require the bank to secure their data and funds, like having enough cash available each day to meet Federal Reserve requirements.

Risk assessment

Asset	Risk(s)	Description	Likelihood	Severity	Priority
Funds	Business email compromise	An employee is tricked into sharing confidential information.	3	2	6
	Compromised user database	Customer data is poorly encrypted.	2	3	6
	Financial records leak	A database server of backed up data is publicly accessible.	3	3	9
	Theft	The bank's safe is left unlocked.	1	3	3
	Supply chain disruption	Delivery delays due to natural disasters.	1	2	2
Notes: How are security events possible considering the risks the asset faces in its operating environment?					
Security events are possible because the bank's funds are exposed through both its people and its systems. With 120 employees handling data, business email compromise remains highly likely, and a publicly accessible backup server can be reached with no effort at all. Customer data is encrypted, but poorly, so it could still be broken with moderate effort. Strict financial regulations mean any of these events would carry heavy fines alongside the loss of funds, customers, and reputation. The bank's low-crime coastal location makes theft unlikely, and hurricanes are infrequent, though both would still directly threaten the bank's ability to meet its daily Federal Reserve cash requirements.					

Prioritisation

The financial records leak scores 9 and is the highest priority. The backup database server is publicly accessible, so the vulnerability requires no effort to exploit, and a leak of financial records would bring heavy regulatory fines alongside the loss of customers and profits. Business email compromise follows at 6, driven by the large human attack surface of 120 employees, any one of whom could be tricked into sharing confidential information. The compromised user database also scores 6: its impact would be catastrophic across 2,200 accounts, but the data is at least encrypted, so exploitation takes moderate effort rather than none. Theft (3) and supply chain disruption (2) are the lowest priorities, since the bank's low-crime location and the infrequency of hurricanes make both unlikely, even though each would still directly threaten the funds the bank must hold to meet Federal Reserve requirements.
